

JF-BA-116

Definition

JF-BA-116 is an oil additive based on high-quality pure mineral oil. This guarantees an excellent miscibility and compatibility with all usual oils for industrial applications, except rape seed oil. The additives added to the oil contributes to a lower wear. It reduces damage caused by metal to metal contact as a result of a broken lubrication film on your application. As a result, it reduces wear, pitting and stick-slip.

Instructions

Addition, 5%. When oil agitates premixing is not necessary. To obtain an optimal result premix in case of slow flowing systems.

Properties

Reduction of friction and wear, improvement of engine elasticity, improvement of cold start, reduction of "Blown-By", reduction of gas- and oil consumption, reduction of pitting, especially in combination with HD-oils, lower starting torque and levels top loads.
